

Fork Positioner for Forklifts

Forklift Fork Positioner - The fork positioner is actually a hydraulic device that can allow the person driving to maneuver the lift truck without leaving the seat. They are made out of high quality materials and are meant to be able to endure the most challenging procedures and work environments. Side shifting units have the added ability to laterally position the entire load or the arms in order to facilitate more accurate lifting and position in a faster and more effective method.

The only one of its kind fork pocket design could enable the one operating it to safely sway the unit's forks without any fear of destroying the positioning cylinders. This can allow the operator the alternative to either execute simultaneous or independent blade movement, dependent upon the job requirement. For most lift trucks with non-OEM carriages, complete carriages are needed. Standard OEM carriages can be transformed into fork positioners on available units.
